Sunday, October 8, 2000 - 10:00 a.m.

In man, the heart is the great architect. Its most important satellites are the brain and the glands. The brain receives the orders and relays them; we have already mentioned this principle. Many receptors receive these instructions and act accordingly. All these systems run at the speed of light. Fundamental discoveries will be made one day on this aspect. The most up-to-date computer does not measure up to this performance. Nothing can equal creation. The results obtained by IT systems are extraordinary, but they are the fruit of man's intelligence, applied to the development of this hardware. He has created this monster, which will end up devouring him. Its power will become such that there will no more be a place for him in society. At the speed things are going, some IT specialists will be enough to run the factories. The administrative wheels and the economy of the countries will be regulated in the same way. What will the human being, confronted with this gigantic scale, become? The answer will be given in the future centuries."
