Monday, October 9, 2000 – 10:00 a.m.

The transmission of impulses that takes place at the level of the autonomic nervous system regulates the various functions of the body. We have alluded to this in the previous message. It is there, in this system, that the speed of light comes in. Physics, as it is now being taught, gives an inkling of this process. The nervous system is a vast network, comparable to a power station. Its function is essential. The exchanges on the cellular level take place through this very complex assembly. It is an admirable mechanism that is far from being understood. There still remains much to be done to identify the multiple capabilities of the human body. The main things, namely the energies that power it, are not known as they should be. Some vanished civilisations that were very advanced in the knowledge of these phenomena were able to go far in treating certain disorders inherent in a poor circulation of energies. Medicine in the Occident deliberately ignores this aspect of the human body, dwelling only on matter; it does not grasp the true problems. All light will be shed in the future on this 'intangible' that puzzles researchers. The majority of them voluntarily leave it aside. A great revolution will be needed on this matter for the good of human beings, who will suffer, more and more, from inexplicable disorders that are due to many forms of pollution."
